Introduction

Chemical reactions

Grain-gas thermal exchange

Photoelectric heating

Heating induced by radiation

Starlight-photoheating
X-rays

Dynamical processes

Overview

2

There are different ways to heat the gas in the ISM, i.e. to transfer energy into the gaseous medium

- ▶ via photons/electrons
- ▶ via chemical reactions
- ▶ via dust grains
- ▶ via dynamical processes

Main processes:

- ▶ elastic collisions
- ▶ collisional de-excitations

49

18

Expressions in literature for $\Gamma_{g \rightarrow d}$ typically written:

$$\Gamma_{g \rightarrow d} = C_{g \rightarrow d} T_g^{1/2} (T_d - T_g) n^2$$

$C_{g \rightarrow d}$ in units of $\text{erg cm}^{-3} \text{s}^{-1} \text{K}^{3/2}$

$${}^5 C_{g \rightarrow d} = 3.8 \times 10^{-33} \left[1 - 0.8 \exp\left(\frac{-75 \text{ K}}{T_g}\right) \left(\frac{10^{-6} \text{ cm}}{a_{\text{min}}}\right)^{1/2} \right]$$

$${}^6 C_{g \rightarrow d} = 3.5 \times 10^{-34}$$

$${}^7 C_{g \rightarrow d} = 6.3 \times 10^{-34}$$

- ▶ intended for use in H_2 -dominated regions
- ▶ assumptions made on $n_d \sigma_d$

29

Heating induced by radiation

Starlight-photoheating

X-rays

Dynamical processes

Overview

Three main parameters influence the photoelectric heating rate

- i) the strength of the radiation J_ν
- ii) the size distribution of the grains
- iii) the charge of the grains

Assumptions and summary

- ▶ PE heating mostly acts on small grains ($a \leq 100 \text{ \AA}$)
- ▶ PE heating most important process in CNM
- ▶ HII region heating dominated by photoheating
- ▶ in the model only C-like grains considered
- ▶ recombination negligible in CNM ($G_0 \sim 1$)

33

The photodissociation and photoionization⁹ induced by FUV radiation generate an excess of energy which can go into heating ($h\nu - E_0$).

Photoheating is mainly caused by

- ▶ atoms photoionization in HII regions ($h\nu > 13.6$ eV)
- ▶ photo-ionization of large molecules and small dust grains in HI regions ($h\nu < 13.6$ eV)
- ▶ molecules photodissociation in molecular regions

- ▶ every CR process releases ~ 35 eV of energy
 - ▶ heating
 - ▶ secondary ionizations

$$\Gamma_{CR}^i = Qk_i^{cr} n_i \rightarrow \Gamma_{CR}^i = Q\alpha_i \xi_{cr} n_i$$

- ▶ great uncertainty in the fraction of heating
- ▶ it varies depending on the environment (if neutral or ionized)
 - ▶ $Q = 7.7$ eV at 2 MeV \rightarrow Glassgold & Langer 1973
 - ▶ $Q = 6.6$ eV at 2 MeV \rightarrow Cravens & Dalgarno 1978
 - ▶ $Q = 6 - 35$ eV \rightarrow Shull & van Steenberg 1985
 - ▶ $Q = 7.0$ eV \rightarrow Stahler & Palla 2004
 - ▶ $Q = 20$ eV \rightarrow Goldsmith 2001
 - ▶ $Q = 13$ eV \rightarrow Glassgold, Galli, & Padovani 2012
- ▶ uncertainty also on ξ_{cr}
 - ▶ $\xi_{cr} = 1 - 2 \times 10^{-17} \text{ s}^{-1} \rightarrow$ a kind of standard

Chemical reactions

Grain-gas thermal exchange

Photoelectric heating

Heating induced by radiation

Starlight-photoheating

X-rays

Dynamical processes

Overview

41

NOTE: the uncertainty introduced by using an averaged Q is typically much smaller than the current uncertainty in the ξ_{cr} in the considered region!

49

Heating induced by radiation (2)

X-rays in KROME

ISM Heating

Stefano Bovino

Introduction

Chemical reactions

Grain-gas thermal exchange

Photoelectric heating

Heating induced by radiation

Starlight-photoheating

X-rays

Dynamical processes

Overview

- ▶ -heating = XRAY
- ▶ check react_xrays to see how to use the X-rays tokens
- ▶ rates and heating (H and He) pre-integrated (tables)
- ▶ $^{11}J_x(E) = 10^{-21} J_{21}(E/E_0)^{-1.5} \rightarrow E_0 = 1 \text{ keV}$

42

#Photoionization of H, He by Xrays,
Shull+1985, Inayoshi+2012

```
@XRAY_start
@format:idx,R,P,P,Tmin,Tmax,rate
24,H,H+,E,NONE,NONE,auto
25,He,He+,E,NONE,NONE,auto
@XRAY_stop
```

Dynamical processes

Overview

43

Current implementation of CR in KROME:

- ▶ CR ionization rates from OSU database
- ▶ $Q = 20$ eV
- ▶ option: -heating = CR

In the network file use the following tokens

```
@CR_start
```

```
257, H, H+, E, 4.6d-1*user_crFlux
```

```
258, He, He+, E, 5.d-1*user_crFlux
```

```
259, O, O+, E, 2.8d0*user_crFlux
```

```
@CR_stop
```

X-rays

Dynamical processes

Overview

45

- ▶ heating at macroscopic scales
- ▶ comes from hydro → not in KROME

Examples:

- ▶ compressional → e.g. during gravitational collapse
- ▶ shocks/turbulence
- ▶ mechanical → stellar winds/SNe explosion
- ▶ viscous heating (e.g. ambipolar diffusion)
